A good lawn beautifies your home, and adds greatly to its commercial value

CHAAPEL'S CLOVER LAWN GRASS SEED

Recleaned and tested seed, weighing 30 pounds to the bushel

Our mixture absolutely can be relied on as being made up of the finest quality of grass seed obtainable, free from weed seeds, chaff or fallow and of the very best and highest germinating qualities. It is a special mixture of grasses that do best in our soils. The increasing demand for a lawn seed having a larger proportion of White Clover induced us to offer this mixture which contains a most liberal quantity of best recleaned White Clover. While primarily made up for normal locations, it contains certain grasses that will thrive on partially shady places. Sow 1 quart to 200 square feet (10 x 20 ft.).

Pt. 30 cts., qt. 40 cts. (postpaid 50 cts.), 2 qts. 75 cts., 4 qts. \$1.40, pk. \$2.40, bus. (30 lbs.) \$8.40.

CHAAPEL'S SHADYGREEN LAWN SEED

Every Home Its Vegetable-Garden

No Vegetables ever come to the home table like those gathered fresh from the home-garden

It's a common saying that a good garden furnishes one-half the food of a family. This is true or false, as we interpret the term "good garden." A real garden is supposed to supply fresh vegetables in abundance during the growing season, a surplus for canning purposes, so that the home may have all the good, wholesome, canned tomatoes, beans, peas, corn, asparagus, etc., that are used during the winter season, and an extra surplus for the market. A good garden supplies something for the table every day in the year.

A garden properly planted and intelligently cultivated is one of the greatest assets of the home and always contributes its full share toward the general welfare, health and prosperity of the home.

Every family on every farm should have a garden; the land owner who cultivates his own land should provide a garden for himself and family; the tenant who cultivates land that is not his own should be given a small piece of land and time enough to grow a garden on it.

It is not right that people who live in the country should depend on the groceries for either their fresh or canned vegetables. We live in a land of sunshine and have unbounded opportunities for gardening.

Cauliflower

For many years cauliflower has been considered one of the most delicious vegetables, but until lately it was thought to be hard to grow. However, it is now known that the same methods that produce good cabbage will grow good cauliflower. The only great difference in culture is that cauliflower heads must be protected from sunlight so as to make sure of the desirable white curd. This is most easily accomplished by gathering the tops of the leaves together loosely as soon as the heads begin to form. In shutting off the light, it is important not to cramp the heads.

Carrots

Carrots contain large amounts of those elements which the human body needs for health and strength. They require about the same simple care as beets, they have no serious insect enemies, and they are rarely attacked by disease. Since freshly manured soil often causes divided roots, it is best to plant them in soil that has been richly fertilized the previous season. Plant the seed one-half inch deep in loose, well prepared soil, making rows 16 to 24 inches apart. Cultivate as soon as the plants are well established and thin to 2 or 4 inches in the row according to the size of the variety. Plantings may be made from early spring until mid-June. For winter storage the later date is advisable.

The superb color, fine quality, crispness and heavy yield all combined will undoubtedly make this the most popular carrot variety on the list as soon as it becomes known. CONTROL OF CORN EARWORM

The ears of sweet corn are attacked by young caterpillars which feed first on the growing silk and later work down into the ear, eating the kernels. Early maturing varieties of plants are less subject to injury from the caterpillars. Sweet corn may be protected by dusting with a combination of lead arsenate and dusting sulphur, using equal parts of the materials. The dust should be applied as soon as silk forms on the developing ears. It may be necessary to make several applications, as the ears do not all develop at the same time.

Whipple's Yellow Sweet Corn

Finest White Sweet Corn

Seeds may be planted either in rows or hills. If planted in rows, they should be spaced from 2½ to 4 feet apart, depending on the height of the variety; seeds should be dropped at the rate of 5 or 6 to the foot, and covered about 2 inches deep. If planting in hills, drop 5 to 6 seeds per hill and space the hills 3 feet apart each way. When plants are 4 to 5 inches tall, thin from 8 to 12 inches apart and keep well hoed until the ears are set.

Garlic BULBS

As an appetizing dash of flavoring for soups and stews, many people use small quantities of this pear-shaped white bulb. In large amounts it has a strong odor and flavor. To grow garlic in the garden, the several sections or "cloves" of each bulb should be separated and set in rows 10 or 12 inches apart and 4 inches apart in the row. They should be taken up in the fall and stored in a cool, dry place until used. 1 oz. 10 cts., 1 lb. 40 cts.

California Wonder

Peppers

Pepper seed should be sown in February or March in a warm hotbed or in a box placed in a sunny window of a warm room. The seeds require plenty of heat and moisture to germinate. Transplant the young seedlings as soon as they can be handled. 6 to 8 weeks are required to raise plants large enough for setting outdoors. One ounce of seed produces about 1500 strong plants.

PEAS

SELECTED FOR OUR CRITICAL TRADE

Our list embraces the newest and highest types in Pea culture. Peas are different from all other vegetables—the seeds are large and only one stem grows from each seed. They do not tiller; the plant is not bushy. They must be planted close together—12 to 16 seeds to the foot.

While a 10-cent packet of lettuce or radishes might suffice for the family garden and yield sufficient portions for numerous meals, a like amount of Peas will not. It requires 1 pound to plant 40 feet of row. Peas form a profitable crop to grow. Plant all you have room for.

All varieties growing more than 1 1/2 feet high do better if staked up or otherwise supported when 4 to 6 inches tall. This support is usually given by sharpened branches of trees set between the double rows. The crop should be gathered as fast as it is fit for use. Even though just a few pods begin to ripen, new pods will cease to form, and those partly advanced stop growing.

RADISHES

One ounce will sow 100 feet of drill

The ground for growing radishes should be finely prepared and as free as possible of small stones and lumps. Plant seed about 1/2 inch deep in rows 12 to 18 inches apart, and when up about an inch thin to 1 or 2 inches apart. Radishes are at their best when growth is quick and steady. A moderate temperature and constant moisture are favorable for best results. Most varieties become pithy soon after reaching full size. In order to keep a continuous supply, successive plantings should be made.

TOMATOES

New Penn State Tomato

Pritchard's Scarlet Topper

Tomato seed is usually planted indoors about Mar. 1st. Use shallow boxes or "flats" and plant in rows about 2 inches apart. As soon as the seedlings are about an inch tall, they are "pricked out" into a larger box and spaced about 4 inches apart. Rich loose soil should be used. When the weather has moderated, the plants should gradually be hardened off to the temperature outside. This can be done in a warm sheltered spot where they can be protected at night and in case of frost. About 6 weeks after seed is sown, the plants are ready for their permanent location.

THE NEW PENN STATE TOMATO

Originated by Pennsylvania State College. Extremely early; foliage is rather coarse, medium dark green. INCREASE Crop PROFITS by Stopping Disease Losses with DUBAY DISINFECTANTS

New Improved CERESAN—for Seed Wheat

New Improved Ceresan effectively controls bunt or stinking smut of wheat, and seedling blight caused by seed-borne scab. Only 1/2 ounce of dust is used, costing 1 7/8 to 2 1/8 cents a bushel of seed. It is easily and quickly applied in a rotary treater or with the shovel. It is non-injurious to the drill and does not retard flow of seed through the drill. It increases wheat profits by reducing losses from smut and dockage. Prices: 1 lb. 75 cts., 5 lbs. \$3.00.

2% CERESAN—for Grains, Flax and Peas

Ceresan effectively controls seed-borne stripe disease and covered smut of barley; smuts of oats; kernel smut of sorghums; millet smut; certain flax diseases; and reduces foot rot diseases of peas. It usually increases yields and profits through preventing diseases. No soaking or wetting—dust only 3 ounces on a bushel of seed barley, peas or oats; and 2 ounces on flax, millet, or sorghums. Prices: 1 lb. 75 cts., 5 lbs. \$3.00, 25 lbs. \$12.50.

Improved SEMESAN BEL—for Potatoes

Seed potato treatment will bring you more profit than ever before. Improved Semesan Bel gave an average increase in yield of 35.4 bushels of potatoes an acre, on six farms by controlling seed-borne scab and Rhizoctonia, reducing seed rotting and improving stands. This quick dip costs 1 1/2 cts. to 3 cts. per bushel of seed. One pound treats 60-80 bushels of seed. Prices: 4 ozs. 50 cts., 1 lb. \$1.65, 5 lbs. \$7.00, 25 lbs. \$31.25.

SEMESAN JR.—for Field and Sweet Corn

Four bushels more corn can be expected by any farmer that treats his seed corn, Experiment Station tests show. Field or sweet seed corn dusted with Semesan Jr. is protected from seed-borne Diplodia, Gibberella, and Basiporium root rots; and from rotting in cold, wet soil. It gives better stands, and larger yields of improved quality. Use 2 ounces a bushel. Costs 2 1/2 cts. to 3 cts. an acre. Prices: 4 ozs. 35 cts., 1 lb. \$1.00, 5 lbs. \$4.75.

SEMESAN—for Flower and Vegetable Seeds

Prevent seed rotting under unfavorable soil conditions, also certain seed-borne diseases, that reduce stands, lower yields and quality—by treating all seed, bulbs or corms with Semesan before planting. It is harmless to the seed, but deadly to disease organisms. It costs from 1/4 ct. to 1 ct. a pound of seed. One ounce treats 15 lbs. of seed. Effective in controlling damping-off and gladiolus diseases such as hard rot and scab. Prices: 2 ozs. 50 cts., 1 lb. \$2.50, 5 lbs. \$11.75.

DU BAY FUNGICIDES—for Brown Patch

Special Nu-Green has been used for years by hundreds of golf courses as the most effective and practical treatment yet devised for preventing and controlling brown patch. Easily applied in liquid form with any convenient type of sprayer. 1 lb. of Nu-Green treats 1,000 to 2,000 square feet of turf. Nu-Green prices: 3 ozs. 50 cts., 1 lb. \$1.65, 5 lbs. \$7.00, 25 lbs. \$30.00, 100 lbs. \$115.00, 300 lbs. \$330.00.

ANTS: Simply enlarge entrances of nest with long-shank screwdriver or pointed stick. Adjust spout of can and allow a small amount of Cyanogas to flow into the enlarged hole. The worker ants and Queen are killed immediately with Cyanogas. Special 4-Oz. Ant Container 30 cts.

MOLES: Open up runways every 10 to 20 feet, and blow Cyanogas A-Dust in both directions with a duster. 1 lb. 75 cts., 5 lbs. \$3.00, 25 lbs. \$10.00, 100 lbs. \$30.00.

WOODCHUCKS: Are very susceptible to the gas liberated by Cyanogas A-Dust, and only one whiff is required to kill them. Place one tablespoonful of Cyanogas as far down the burrow as possible. Use long-handle spoon. Upset Cyanogas in a small pile. Close entrances tightly with up-turned sod. 1 lb. 75 cts., 5 lbs. \$3.00, 25 lbs. \$10.00, 100 lbs. \$30.00.

RATS: Cyanogas is not a bait! It is different! Simply pump it into rat burrows or hideouts, it seeks the rats and kills them instantly. 1 lb. 75 cts., 5 lbs. \$3.00, 25 lbs. \$10.00, 100 lbs. \$30.00.

GREENHOUSE PESTS: Cyanogas G-Fumigant, when exposed to air gives off a gas destructive to all plant insects. It is the most generally used insecticide in greenhouses. It is the most economical of all greenhouse insecticides, and is completely effective and very easy to use. 5 lbs. \$3.00, 25 lbs. \$10.00, 100 lbs. \$30.00.

OTHER PESTS: Such as fleas, bees, bats, squash bugs, cucumber beetles, termites, etc., are easily controlled with Cyanogas. Leaflets containing instructions on the control of practically all pests are available.
